ABSTRACT

A framework for use of satellite earth observation data is necessary for maximizing the use of satellite observations to advance health-related SDG-3 targets. This presentation will discuss a Country Framework for Use of Satellite Earth Observation Data to make progress toward achieving health related SDG 3 targets. The framework will address the mapping of country-specific health-related activities to earth observations in the following dimensions: health technical areas, resource needs and research agenda. The Framework will also address the collaborative opportunities of space agencies and public health institutions.
